

HTML

CSCI311

Learning Objectives

- ▶ Review html
- ▶ Learn to write a basic webpage in html
- ▶ Understand what the basic building blocks of html are

HTML: Hypertext Markup Language

- ▶ HTML5 is new standard that replaces previous versions of HTML
- ▶ *elements* are used to structure the page content
 - ▶ e.g., `<h2>` second-level header, `<p>` paragraph
- ▶ markup language:
 - ▶ tags are added to content to give it structure
- ▶ open tag `<xyz>`
- ▶ closing tag `</xyz>`
- ▶ self-closing tag `<xyz />`
- ▶ tags are always surrounded by `< >`

Basic structure of HTML file

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml" lang="en">
  <head>
    <meta charset="utf-8"/>
    <title>Basic Web Page</title>
    <!-- other head stuff -->
  </head>
  <body>
    <!-- page content here -->
  </body>
</html>
```

HTML elements

- ▶ over 100 different html elements
- ▶ meta information is placed in the head element
- ▶ content information is placed in the body element
- ▶ Two main kinds of element:
 - ▶ flow elements (or block)
 - ▶ phrasing element (or inline)

Classifying HTML elements

- ▶ top-level elements: html, head and body
- ▶ head elements: placed inside the head
 - ▶ title
 - ▶ style
 - ▶ link
 - ▶ meta
 - ▶ base
 - ▶ script
- ▶ do not display on the page

Classifying HTML elements

- ▶ block-level elements
 - ▶ flow elements that behave like paragraphs
 - ▶ occupy 100% of available width
 - ▶ stacked vertically with preceding and subsequent block elements
 - ▶ article, h1-h6, header, footer, section, p, figure, canvas, pre, div
 - ▶ ul, ol, dl, table, form, video

Classifying HTML elements

- ▶ inline elements
 - ▶ phrasing elements that behave like words
 - ▶ flow horizontally
 - ▶ usually placed inside block elements
 - ▶ a (anchor), audio, br, code, img, em, nav, samp
 - ▶ span, strong, sub, sup, time, var

Syntax of HTML

- ▶ All tags begin with `<` and end with `>`
- ▶ tag name is given immediately following opening `<`
- ▶ unrecognized tags are ignored
- ▶ *attributes* are given following the tag name:
 - ▶ `<tag attribute1="value" attribute2="value" ...>`
 - ▶ ' can be used instead of "
 - ▶ forgetting to close a quote can result in a blank page
- ▶ *names* and *attributes* are lowercase
- ▶ *values* are case sensitive
- ▶ attributes that have boolean values:
 - ▶ true: `attribute_name="attribute_name"`
 - ▶ false: `attribute_name=""`

Syntax of HTML

- ▶ unrecognized tags and attributes are ignored
- ▶ elements without closing tags are of the form ``
 - ▶ ending `/` is optional for HTML5, needed for polyglot documents
- ▶ elements must be well-formed
- ▶ no bad nesting
 - ▶ `<p>Stuff </p>`
- ▶ attributes can be in any order
- ▶ white space is allowed
 - ▶ between tag name and attributes
 - ▶ around the `=` sign
 - ▶ within attribute value (but should be avoided)
- ▶ body element may only directly contain block elements
 - ▶ no free-standing text
 - ▶ no inline elements

HTML core attributes

- ▶ All HTML5 elements can have the following:
 - ▶ id - uniquely identifies an element in the page
 - ▶ style - gives presentation style
 - ▶ class - style class, or space-separated list of style classes
 - ▶ title - title for the element. Can be used as tool-top display
 - ▶ hidden - prevents element from being displayed when set to true
 - ▶ contenteditable, draggable, dropzone, spellcheck, and more

Typical Webpage Architecture

- ▶ In detail we will look at:
 - ▶ Headings and Paragraphs
 - ▶ White space and line wrapping
 - ▶ presentation styles
 - ▶ lists
 - ▶ links
 - ▶ navbars
 - ▶ images
 - ▶ layout
 - ▶ validation

Headings and Paragraphs

- ▶ Six heading levels: h1-h6
 - ▶ block elements
- ▶ paragraph element: p
 - ▶ can contain text and phrasing elements
 - ▶ typically has a new line before and after
 - ▶ lines wrapped to fit width
 - ▶ extra white space in text ignored
- ▶ break element: `
` can be used to insert blank line
- ▶ line break opportunity: `<wbr />` can be used to break up long-running text like urls and emails

Headings and Paragraphs

- ▶ inline (phrasing) elements can be placed in a paragraph
 - ▶ em
 - ▶ emphasis
 - ▶ q
 - ▶ quote
 - ▶ mark
 - ▶ highlight
 - ▶ strong
 - ▶ like bold
- ▶ paragraphs and headings are left aligned by default

White Space and Wrapping

- ▶ in HTML white space separates text into words
 - ▶ space (ASCII 32, entity ` `)
 - ▶ tab (ASCII 9, entity `	`)
 - ▶ formfeed (ASCII 12, entity ``)
 - ▶ zero-width space (entity `ÈB;`)
- ▶ whitespace collapsing
 - ▶ only one white space is rendered between characters
- ▶ line-breaking white space entities
 - ▶ return (ASCII 13)
 - ▶ newline (ASCII 10)
 - ▶ only linebreak the code, not the content

White Space and Wrapping

- ▶ Only whitespace separates words:
 - ▶ tags don't
 - ▶ e.g., `<p>The HTML5 standard.</p>`
 - ▶ Yields: The **HTML5** standard
- ▶ to force a line break:
 - ▶ `
`
- ▶ to force two words to stay on a line:
 - ▶ non-breaking white space: ` ` or ` `
- ▶ to indicate where a word can be broken across a line with a hyphen:
 - ▶ soft hyphen: `­`
- ▶ to indicate where long words can be broken across a line without a hyphen:
 - ▶ `<wbr />`

Phrasing (inline) elements

- ▶ link: a
- ▶ line break: br
- ▶ citation: cite
- ▶ emphasis (usually italics): em
- ▶ strong emphasis (usually bold): strong
- ▶ stronger emphasis (usually highlight): mark
- ▶ computer code: code
- ▶ deleted words (crossed out): del
- ▶ subscript: sub
- ▶ superscript: sup
- ▶ sample computer output: samp
- ▶ general phrasing element that can contain other phrasing elements: span

Presentation Styles

- ▶ To add non-default presentation style we use *style rules*
- ▶ Three ways:
 1. place rules in a style sheet
 2. include `<style>` elements in the head element
 3. use the style attribute for individual elements

```
<h1 style="color: darkgreen">This is Green</h1>
```

- ▶ style attribute takes precedence over styles in the style element
- ▶ style element takes precedence over style sheets

Some style properties

- ▶ foreground colour
 - ▶ color
- ▶ background colour
 - ▶ background-color
- ▶ text alignment
 - ▶ text-align
 - ▶ e.g., text-align: left - left justified
- ▶ font size
 - ▶ font-size
 - ▶ e.g., font-size: x-small
- ▶ indentation
 - ▶ text-indent
 - ▶ e.g., text-indent: 3em
- ▶ margin
 - ▶ margin-left: *length*
 - ▶ margin-right: *length*

Style Length Units

- ▶ relative lengths:
 - ▶ em: font-size of the current font
 - ▶ ex: the x-height of the current font
 - ▶ ch: the size of 0 in the current font
- ▶ absolute lengths (avoid)
 - ▶ cm: centimeters
 - ▶ in: inches
 - ▶ mm: millimeters
 - ▶ pc: picas (1pc = 12pt)
 - ▶ pt: points (1pt = 1/72in)
 - ▶ px: pixels (1px = 1/96in)
 - ▶ not sensitive to resolution, or font size

Colours

- ▶ There are a number of ways to specify colours
- ▶ by name
 - ▶ e.g., red, green, magenta
 - ▶ ~150 colour names in CSS
 - ▶ w3.org/TR/css3-color/#rgba-color
- ▶ by rgb value:
 - ▶ #rrggbb
 - ▶ #rgb
 - ▶ rgb(r, g, b) - base 10 numbers between 0 and 255
 - ▶ rgb (r%, g%, b%)
 - ▶ rgba (r, g, b, a) a is alpha, ranging from 0 to 1
 - ▶ rgba (r%, g%, b%, a)
- ▶ hsl (hue, saturation, light)
 - ▶ hsl(h, s%, l%) h is degrees 0 - 360
 - ▶ hsla(h, s%, l%, a)

Font

- ▶ font-family property lets you set font
 - ▶ e.g., font-family: Times
- ▶ can list more than one font
 - ▶ e.g., font-family: Arial, Helvetica, sans-serif
- ▶ always good to list a generic font family last, in case fonts are not found on host
- ▶ multi-word font family names enclosed single or double quotes

Font

- ▶ font-weight property controls how heavy font is
 - ▶ e.g., font-weight: bolder
- ▶ font-size property controls size of font
 - ▶ to a specific size
 - ▶ e.g., font-size: small
 - ▶ to an absolute size
 - ▶ e.g., font-size: 16pt
 - ▶ relatively
 - ▶ e.g., font-size: smaller (or percentage)

Lists

- ▶ Three kinds of list in html5:
 - ▶ bullet list
 - ▶ ul element
 - ▶ ordered list
 - ▶ ol element
 - ▶ definition list
 - ▶ dl element
 - ▶ each term `<dt>` is given a definition `<dd>`
 - ▶ dt element can contain inline elements
 - ▶ dd element can contain inline and block elements
- ▶ ul and ol can only contain list elements
 - ▶ li
- ▶ li can contain block elements like paragraphs, headings and other lists

List styles

- ▶ Default list item marker for ul and ol is browser-dependent
- ▶ list-style-type property lets you customize list:
 - ▶ e.g., `<ul style="list-style-type: circle"> ... `
 - ▶ e.g., `<ol style="list-style-type: upper-alpha"> ... `
- ▶ style types include:
 - ▶ disc, circle, square, none, decimal, lower-roman, lower-alpha...
 - ▶ you can make an ul numbered
 - ▶ you can make an ol with bullets
- ▶ list-style-image: `url(imageURL)` lets you customize bullet with an image
- ▶ list-style-position
 - ▶ value outside or inside

Links

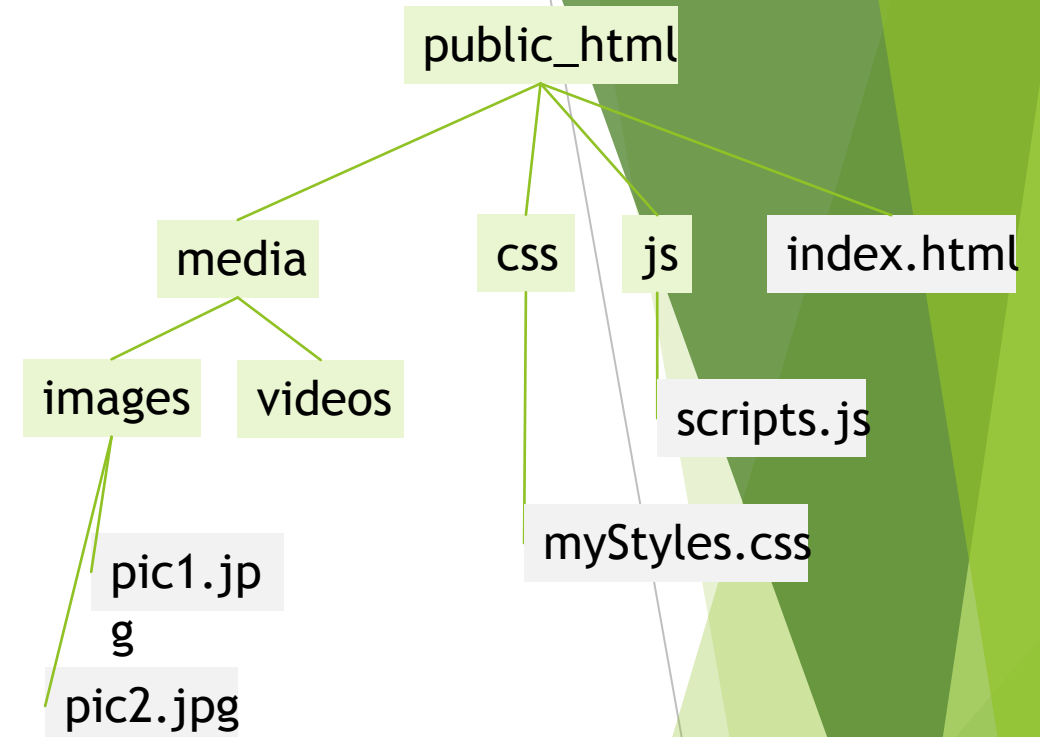

- ▶ anchor tag: a
 - ▶ e.g., `anchor`
- ▶ anchor can be: text, image, button, video
- ▶ link can also be attached to part of an image map
- ▶ links can be to
 - ▶ other web pages
 - ▶ e.g., `VIU`
 - ▶ local files (using relative paths)
 - ▶ e.g., `Doggy`
 - ▶ to parts of an html document (using the id attribute)
 - ▶ e.g., `Products`

Links

- ▶ When opening external links (outside your site) it is good practice to open link in separate browser window
 - ▶ `The W3C Consortium`
- ▶ Make it clear that click will leave your site:
 - ▶ placement of link in sidebar

Site Organization

- ▶ Place home file (usually index.html) in root directory
- ▶ use directories to organize files:
 - ▶ images/, videos/, css/, js/, products/, services/
 - ▶ an index.html within each of these directories can be used as the lead page for that heading
- ▶ keep organization simple
 - ▶ no more than depth 3
 - ▶ make sure navigation is simple and straightforward for user

Linking to services

- ▶ to email
 - ▶ ``
 - ▶ e.g., `contact Sarah`
 - ▶ note use of %20 to include spaces in subject line
- ▶ Download links:
 - ▶ ``
- ▶ Telephone/SMS/Fax:
 - ▶ ``
 - ▶ ``
 - ▶ ``
- ▶ VOIP
 - ▶ ``

Navbars

- ▶ Common to have horizontal and vertical navbars
- ▶ Main navigation commonly on horizontal
- ▶ Secondary navigation in vertical
- ▶ nav element creates navbars
- ▶ We will revisit this, including side nav and styling later

Images

- ▶ To include an image in a page:
 - ▶ ``
 - ▶ self closing tag
 - ▶ src attribute gives URL to download image to be displayed
 - ▶ it replaces the img tag in content of page
 - ▶ **do not hot link images**
 - ▶ alt tag is **required**, gives alternate text (not tool tip)
 - ▶ optional height and width attributes
 - ▶ best practice is to make sure it matches original, or very close to it
- ▶ To make a clickable image link
 - ▶ place an image tag in the anchor of `<a>`

Layout

- ▶ Come up with a clear and consistent layout
- ▶ Make sure important things are easy to find

Debugging and Validation

- ▶ After you've written your code:
 - ▶ spell check
 - ▶ test with many browsers
 - ▶ test on different platforms
 - ▶ test on different screen size/resolution
 - ▶ can be done within browser too, but best to also test on devices
 - ▶ Test all links
 - ▶ validator.w3.org/checklink
 - ▶ Use a validator:
 - ▶ validator.w3.org for HTML
 - ▶ jigsaw.w3.org/css-validator for CSS

Summary

- ▶ HTML is used to structure content
- ▶ We've seen a number of different kinds of elements
- ▶ Block and inline elements
- ▶ Basic structure and contents of a web page
