CSC 260 Test: Big-Oh Notation and Union-Find Forests
Oct 62022 Instructor: Gara Pruesse
Out of 37 marks

1. (2 marks) Prove the following claim using only the definition of Big-Oh and valid transformations around the less-than-or-equal-to relation:

$$
\begin{aligned}
& \text { Claim: } 4 n^{2}-n+16 \in O\left(n^{2}\right) \\
& \begin{array}{rlrl}
4 n^{2}-n+16 & \leq 4 n^{2}+16 & \forall n & \geqslant 1 \\
& \leq 5 n^{2} & \forall n \geqslant 4
\end{array}
\end{aligned}
$$

$\therefore 4 n^{2}-n+16 \in O\left(n^{2}\right)$, demonstrated by

$$
c=5, \quad n_{0}=4
$$

2. (4 marks) Prove using either method the following claim. Do not use the less-than rule. Can use Theorem: $1 \in O(\log n)$ Claim: $\left(4 n^{2}+7 n\right) / \log n \in O\left(n^{3}\right)$
3. $1 \in O(\log n)$
4. $\log n \in O(1) \quad 1$, Recipe
5. $4 n^{2}+7 n \in O\left(n^{3}\right)$ Polynomial Rule
6. $\left(4 n^{2}+7 n\right) / \log n \in O\left(n^{3}\right) \quad 2,3$ Product Rule.
7. (6 marks) Use the Master Theorem to determine the running time if the recurrence relation for the running time is the following:
a) $T(n)=3 T(n / 5)+n^{2}$

$$
n^{\log _{6} a}=n^{\log _{5} 3} \cong n^{0,68}
$$

$n^{2} \in \Omega\left(n^{0.68+\varepsilon}\right)$; and $\exists c, 0<c<1$, such that $3\left(\frac{n}{5}\right)^{2}<c n^{2}$, i.e. Such that $\frac{3}{25} n^{2}<n^{2}$, for example $c=\frac{4}{25}$ will work.
Hence by MT case 3, Tin) $\in \theta\left(n^{2}\right)$
b) $T(n)=5 T(n / 3)+n^{2} n^{\log _{b} a}=n^{\log _{3} 5}=n^{1.47}$
$n^{2} \in \Omega\left(n^{1.47+\varepsilon}\right)$, and $\exists C, 0<c<1$, such that $5\left(\frac{n}{3}\right)^{2}<c n^{2}$ ie $\frac{5}{9}<c$; for example, $c=\frac{6}{9}$ will work. $\because$ By MT case 3, $T(n) \in \theta\left(n^{2}\right)$
4. (4 marks) Prove the following Claim.

Claim: $n^{4}-\mathrm{n}$ is not in $\mathrm{O}\left(n^{3}\right)$
Proof: BWOC. Suppose $n^{4}-n \in O\left(n^{3}\right)$
$\Rightarrow \exists \stackrel{\text { constants }}{c}>0, n_{0} \geqslant 1$ such that $n^{4}-n \leq c \cdot n^{3} \forall n \geqslant n$ 。

$$
\begin{aligned}
& \Rightarrow n^{4} \leq c \cdot n^{3}+n \quad \forall n \geqslant n_{0} \\
& \Rightarrow n^{4} \leq C \cdot n^{3}+n^{3} \forall n \geqslant \max \left(n_{0}, 1\right) \\
& \Rightarrow n \leqslant C+1 \quad \forall n \geqslant \max \left(n_{0}, 1\right) \\
& \Rightarrow \notin \\
& \therefore n^{4}-n \notin O\left(n^{3}\right) \quad
\end{aligned}
$$

5. (4 marks) Prove the following claim using the Rules (Facts) of Big-O.

Claim: $5 n^{3} \in \mathrm{O}\left(n^{4} / \log n\right)$

1. $\log n \in O(n)$ SBTLLOgDom Rule
2. $\frac{1}{n} \in O\left(\frac{1}{\log n}\right) 1$, Recip.
$3.5 n^{4} \in O\left(n^{4}\right)$
3. $5 n^{3} \in O\left(n^{4} / \log n\right) 2,3$ Product Rule.
4. (4 marks) Prove the following claim using the Rules (Facts) of Big-O.

Claim: $\frac{1}{3} n \log n+\log n \in O\left(n^{2} \log n\right)$

1. $\mid \in O\left(n^{2}\right)$ Polynomial
2. $\log _{n} \in O(\log n) \quad C F$
3. $\log n \in O\left(n^{2} \log n\right) 1,2$ Product
4. $\frac{1}{3} n \in O\left(n^{2}\right)$ Polynomial
5. $\frac{1}{3} n \log n \in O\left(n^{2} \log n\right)$ 2,4 Product Rule.
6. $\frac{1}{3} n \log n+\log n \in O\left(n^{2} \log n\right)$ 3,5, Sum Rule
7. (4 marks) Sort the following functions in terms of their rate of growth, in the Big-O sense. Put the slowest growing functions on the left (the slowest growing functions are running time of the fastest algorithms). If two functions are in the $\Theta$ of one another, ie., in the BigO sense they have the same running time, then group them together in curly braces.

$$
\log 2^{n}, 2^{\log n+\log \log n}, n^{1.5}, n^{1.5} \log n, 150 n^{2}, n^{2} \sqrt{\log n}, n^{2} \log n, 2^{2 n}
$$

8. a) ( 5 marks) Assume a disjoint set starts with 8 elements, each named by a number from 0 to 7 , each in their own set, upon which the following sequence of merge operations are performed, one after another. Show all stages of the forest as it evolves under the operations, assuming the Quick-Union implementation of union-find, where union-by-rank is implemented but path compression is not. If two trees have the same rank, then let the first parameter tree be the one that is made into the root of the resulting tree. You may give the forests as a series of values of the parent array data structure (be sure to also include the rank array data structure); or you may show the results just by drawing the tree that results (you don't have to redraw, at each stage, the trees that do not change in that stage); be sure to indicate the rank of the root.
merge $(6,7)$, merge $(0,6)$, merge $(1,5)$, merge $(2,4)$, merge $(1,4)$, merge $(6,3)$, merge $(1,0)$

$(3)^{\circ}$

b) (2 marks) Show the resulting tree if, after that series of merges, the find operation now has path-compression, and merge $(7,4)$ is called. You need only show the affected tree. Show the rank of the root.

9. (2 marks) Give the recurrence relation that is the running time of the following procedure.

$$
\begin{gathered}
\text { Shuffle( A[1..n]) \{ } \\
\text { Shuffle( A[1..n/4] ) } \\
\text { Shuffle( A[2n/4.. 3n/4]) } \\
\text { Shuffle( A[n/4..2n/4) } \\
\text { Do } \Theta\left(n^{1.5}\right) \text { work here } \\
\} \\
T(n)=3 T\left(\frac{n}{4}\right)+n^{1,5}
\end{gathered}
$$
