

Aside: $E_{DFA} = \sum (\{q_0\}, \{a, b\}, \{?, q_0, \emptyset\}), (\{q_0\}, \{a, b\}, \dots) \dots$

Decidability (cont'd) $E_{DFA} = \{ \langle A \rangle \mid A \text{ is a DFA, } L(A) = \emptyset \}$

Thm 4.4 E_{DFA} is decidable.

Proof: E_{DFA} is decided by TM T where:

- $T =$ "on input $\langle A \rangle$, where A is a DFA :
1. Mark the start state of A .
 2. Until no new states get marked, do :
 - 2.1 Mark any unmarked state that has a transition into it from a marked state.
 3. If no accept state is marked, ACCEPT.
Otherwise, REJECT."

The loop in step 2 will terminate
 - # iterations cannot be greater
terminates than number of states in A .

Correctness:

$\exists$ a string accepted by $A \iff \exists$ a directed path from start state to an accept state in A .

Correctness

$\iff$ an accept state gets marked by T . $\square$

$EQ_{DFA} = \{ \langle A, B \rangle \mid A \text{ and } B \text{ are DFAs, and } L(A) = L(B) \}$

- tutorial.

$$A_{CFG} = \{ \langle G, w \rangle \mid G \text{ is a CFG, that generates string } w \}$$

Theorem: A_{CFG} is decidable.

Proof: The TM S decides A_{CFG} :

$S =$ " on input $\langle G, w \rangle$ where G is a CFG and w a string:

1. Convert G to CNF.
2. List all derivations of length $2n-1$ where $|w| = n$ (or if $w = \epsilon$, where $n = 1$).
3. If any of the derivations derive w , ACCEPT. otherwise, REJECT. "

S always halts because $\exists$ a finite # of derivations of length $2n-1$. It is correct, because it only accepts if it finds a derivation of w .

$$E_{CFG} = \{ \langle G \rangle \mid G \text{ is a CFG and } L(G) = \emptyset \}$$

$$\emptyset \neq \{\epsilon\}$$

eg

$$\begin{aligned} D &\rightarrow ABC \\ A &\rightarrow Aa \mid BB \\ B &\rightarrow bB \mid b \\ C &\rightarrow Dc \end{aligned}$$

Theorem 4.8 E_{CFG} is decidable.

Proof: E_{CFG} is decided by TM R :

$R = "$ on input $\langle G \rangle$, where G is a CFG:

1. mark all terminals in G (on RHS of rules)

2. Repeat until no new variables are marked:

2.1 Mark any variable A where A

has a rule $A \rightarrow \sigma_1 \sigma_2 \dots \sigma_n$

all marked.

3. If start symbol is not marked, ACCEPT, otherwise REJECT."

[we argued as to why this is correct; it terminates because at least one variable is marked at each iteration - we run out of variables in finite # of steps] 

Eg R accepts $(\{S\}, \{a, b\}, \{S \rightarrow SS\}, S)$

R rejects $(\{S\}, \{a\}, \{S \rightarrow a\}, S)$

✓
 $S \rightarrow AB$
 $A \rightarrow \underline{01} \mid \underline{0A}$
 $B \rightarrow \underline{0A1} \mid \underline{1A0}$
 REJECT.

Chapter 4.2 Undecidability

$\exists$? a problem / language that a computer (TM) cannot recognize?

$\exists$? a problem / language that a computer (TM) cannot decide?

Claim: The language $\text{TMencodings} = \{ \langle M \rangle \mid M \text{ is a TM over } \Sigma \}$ is countably infinite.

Proof: Sketch: 1. Each TM has an encoding over the

alphabet $\Gamma = \{ (,), \triangleright, 0, 1, \{, \} \} \cup \Sigma$.

2. The strings over Γ are enumerable (eg in shortlex order)

3. Remove the strings that are NOT a TM encoding, and you are left with a loose enumeration of TM encodings.

Theoretically, we could enumerate all the TM encodings in shortlex order. $\langle M_1 \rangle, \langle M_2 \rangle, \langle M_3 \rangle, \dots$

correspondingly we have a list

$M_1, M_2, M_3, \dots$

Claim: The set of languages over Σ is uncountable.

Proof:

Enum. of the languages over Σ .

Shorter. enum. of strings over Σ .

inclusion vector

		w	a	b	aa	ab	ba	bb	$\dots$
L_1	1	0	0	1	1	1	1	0	$\dots$
L_2	0	1	1	0	1	0	1	1	$\dots$
L_3	1	1	1	0	1	0	1	1	$\dots$
L_4				1					$\dots$
$\vdots$									$\dots$

Diagonalization shows that the number of Languages over Σ is uncountable! $\square$

Corollary: $\exists$ languages that are not Turing recognizable.

Do $\exists$ languages that are recognizable but not decidable?

Let us define a table S "encoding acceptance"

TM

$\langle M_1 \rangle$ $\langle M_2 \rangle$ $\langle M_3 \rangle$ $\langle M_4 \rangle$ $\dots$

M_1	0	1	0	0	$\dots$
M_2	1	0	1	1	1
M_3	0	0	1	0	0
M_4	1	0	1	1	0
M_5	1	0	0	$\dots$	$\dots$

Let $D[i] = S[i][i]$

if $\underline{D[i]} = \begin{cases} 1 & \text{then } M_i \text{ accepts } \langle M_i \rangle \\ 0 & \text{then } M_i \text{ does not accept } \langle M_i \rangle \end{cases}$

SelfAcc = $\{ \langle M \rangle \mid M \text{ is a TM that accepts } \underline{\langle M \rangle} \}$

SelfAcc is the language of TMencodings that are encodings of TMs that would halt-accept when run on their own encoding as input.

SelfNotAcc = $\{ \underline{\langle M \rangle} \mid M \text{ is a TM that does not accept } \langle M \rangle \}$

Note that $\text{SelfNotAcc} = \overline{\text{SelfAcc}} \cap \underline{\text{TM encodings}}$

We have seen that TMencodings is decidable.

The following theorem is useful:

Theorem: The class of decidable languages is closed under complement, $\cap$, $\cup$.

Proof: $\cup$, $\cap$ left as an exercise.

Complement: let L be any decidable language, and let M be a TM that decides L . Then we can construct a new TM $\bar{M}$ that decides $\bar{L}$ as follows:

$\bar{M}$ = " on input $\langle w \rangle$

1. Run M on $\langle w \rangle$;

if M accepts, REJECT.

if M rejects, ACCEPT."

1 Always terminates.

2. Correct.

Mar 21

Theorem: SelfNotAccept is not decidable

Proof: We have seen that the TM encodings are enumerable, for example in Shortlex order.

Then we can construct the following table:

Table S

	$\langle M_1 \rangle$	$\langle M_2 \rangle$	$\langle M_3 \rangle$	$\langle M_4 \rangle$	$\langle M_5 \rangle$	$\langle M_6 \rangle$	$\langle M_7 \rangle$	...	$\langle M_{1059} \rangle$	...	$\langle M_{29467} \rangle$
M_1	0	1	0	1	1	0	1	...			
M_2	1	1	0	1	1	1	0	...			
M_3	0	0	1	1	1	1	1	...			
M_4								...			
$\vdots$											
$M_{1059} = \text{SelfAcc}$	0	1	1	0	1	0	1	...	...	...	...
$M_{29467} = \text{Self Not Accept}$	1	0	0	1	0	1	0	...	...	...	...

Each TM M_i can be fed input $\langle M_j \rangle$, and M_i either accepts or does not.

$$\text{SelfAcc} = \{ \langle M_i \rangle \mid S[i][i] = 1 \}.$$

and the inclusion vector of SelfAcc is the diagonal of Table S.

The inclusion vector of SelfNotAcc is the "bit flip" of the diagonal of Table S.

↑
0 → 1
1 → 0

But then where is TM SelfNotAccept in our enumeration?

It's inclusion vector is the flip of the diagonal, so this inclusion vector is NOT in the table itself — it is not a TM that can exist!

Another way of putting it is the following:

Theorem 4: Self Not Accept is not decidable.

Proof: BWOC. $\nexists$ SelfNotAccept is decided by some TM X.

If X accepts $\langle X \rangle$, then

$\Rightarrow X$ is self-accepting

$\Rightarrow \langle X \rangle \notin \text{SelfNotAccept}$

$\Rightarrow X$ does not accept $\langle X \rangle$

$\Rightarrow \Leftarrow$

If X does not accept $\langle X \rangle$

$\Rightarrow X$ is not self-accepting

$\Rightarrow \langle X \rangle \in \text{SelfNotAccept}$

$\Rightarrow X$ accepts $\langle X \rangle$

$\Rightarrow \Leftarrow$

Either way, there is a contradiction.

$\therefore X$ does not exist, and SelfNotAccept
is undecidable. 

Theorem: SelfAccept is not decidable.

Proof: BWOC. $\S$ SelfAccept is decided by some TM Y .

Then we can construct a TM X that decides SelfNotAccept as follows:

$X =$ " on input $\langle M \rangle$ where M is a TM:

1. Run Y on $\langle M \rangle$

-if Y accepts, REJECT.

-if Y rejects, ACCEPT."

X clearly returns the opposite answer to Y , accepting TM-encodings that reject themselves, and rejecting those that accept their own encodings — i.e., X decides SelfNotAcceptance, which contradicts Thm 4, above.

Note: we skipped the part where we reject the input if it is not a proper TMencoding. Perhaps it should read...

$X = "$ on input $\langle w \rangle$:

0. Run T on $\langle w \rangle$, where T is a TM that decides TMencodings.

If T rejects, REJECT.
otherwise, go to step 1.

1. run Y on $\langle w \rangle$, (where we now know $\langle w \rangle = \langle M \rangle$ for some TM M).

⋮
etc. Just like the proof we gave above. "

It is our practice to just represent the above step 0 as "on input $\langle M \rangle$, where M is a TM"
